ABSTRACT OF THE DISCLOSURE

A container includes a chamber containing a carbonated drink, a drink dispensing opening for dispensing the drink from the chamber, a pressure medium chamber with an outlet closed by a valve for delivering pressure medium, and a pressure regulating element connected to the valve for operating the valve, with the pressure regulating element having a housing with an end wall, a peripheral wall, and a piston that can be moved in the housing along the peripheral wall in a sealed manner, with an upper housing part formed between a side of the piston that faces the end wall, and with a lower housing part that at least partially surrounds the valve, which is formed at the side of the piston facing away from the end wall. The piston engages the delivery valve, and the upper housing part of the housing is in fluid communication with a reference pressure source.
